

WorksRecorded

Construction site data analytics

For construction contractors

Problem: Construction contractors don't have the skills to collect and analyze site data.

WorksRecorded will do it for them

01 Losing money

No data → no visibility → bad decisions → losing money

02 Costs are unpredictable

Will the project be profitable? Without data, you can't answer.

Why don't contractors use data?

01 Hard to collect

How do you even track what 20 workers do during the day?

02 Hard to structure

What do you record, and how?

03 Hard to analyze

What do you do with 2,000 Excel rows after a year-long construction project?

How we help

01 Provide a data collection tool – WhatsApp automation

The site manager sends a WhatsApp voice message describing the day's work.

02 WorksRecorded analyzes and structures messages

WorksRecorded turns messages into structured records and tracks costs against the budget.

03 The project manager or owner receives analytics

Spending breakdowns, delays, additional work and progress reports – everything needed to make decisions based on data.

WhatsApp message

Jānis Rumba

Today, 60 m³ of sand was delivered and 70 m³ was placed. The excavator operator worked 10 hours. There were also two construction workers, a foreman and an assistant site manager. Other contractors kept getting in the way and holding us up. The job is complete. All material has been delivered and placed.

English translation of the supplied product record

ICP - specialty trade contractors

10–49

Employees in the company

Enough operational complexity to need better records.

Limited capacity to build and maintain an internal system.

Adjacent opportunity: medium-sized manufacturers, with ZTC as an early customer.

Market size

Specialty construction enterprises with 10–49 people employed

Latvia: initial market

616

enterprises

€2.22M / year

annual software opportunity

Europe: EU-27 market

~142,000

enterprises

~€511M / year

annual software opportunity

Sizing at target price: €300/company/month. Annual potential at full penetration.

Eurostat, NACE 43, 10–49 people employed. Latvia: 2024. EU-27: 2023, includes estimates.

Five active subscriptions

€780

monthly recurring revenue

~€150

average monthly revenue
per company

€9,360 annualised revenue. Exact current average: €156/company/month.

Current customer revenue

TGEM	€250 / month
Limeni.lv	€180 / month
ZTC	€150 / month
Stone and Tree	€120 / month
SIA 1212	€80 / month
SB STOMME (trial ongoing)	€90 / month after trial

Outside MRR: one free pilot, one active trial and one former paying customer.

Current pricing and target pricing

Current average revenue is about €150/company/month. Target: €300/company/month.

~€150

current average / company / month

€300 target / company / month

- Test a company subscription
- Define included users and features
- Validate upgrades with paying clients

Company subscription	Current average	Target price
Annual revenue per company	~€1,800	€3,600

Current billing: €50/user/month, adjusted for discounts and custom features.
The €300 company price is a target. Included scope and adoption remain to be tested.

Alternatives and our focus

Our proposed advantage: site teams report through WhatsApp, and owners receive structured analytics.

Alternative	What it offers	Our focus for a small contractor
WhatsApp + Excel	Messages and flexible spreadsheets	Convert site updates into structured records and reports
Fieldwire	Plans, tasks, reports and forms	Collect WhatsApp voice updates, with supported setup
Buildertrend	Daily logs plus project and financial tools	Deliver focused reporting without a full platform rollout

We need to prove the advantage through activation, reporting consistency and time saved.

What one year of outreach has shown

Approximately 80 companies approached over about one year through outreach and Facebook.

~80

companies approached

5

currently paying

1

former payer churned

Also in progress: one free pilot and one active trial

6.25% currently paying / approached. 7.5% became paying customers.

Seven signed in total, including one free pilot. One paying customer left after 3 months.

Revenue scenarios from early acquisition results

~80 approached: 7 signed, including 1 free pilot and 1 payer who left after 3 months.

5 current payers ÷ 80 approached = 6.25%

Companies reached × 6.25% × €150/month × 12

Reach scenario	Paying companies	Annualised revenue
80 companies (observed sample)	5	€9,000
616 companies (all Latvia ICP)	~39	~€69,300
141,914 companies (all EU-27 ICP)	~8,870	~€15.97M

Conditional scenarios assume the same ratio after reaching every company shown.
€150 is a modelling average. Results use unrounded counts and are not a sales forecast.

The next 90 days: test a repeatable sales process

Proposed experiments, with results deciding the next spending step.

Latvia: targeted outbound

Build a list of 10–49 person contractors. Track each contact, demo, trial and payment.

Turn demos into live project trials

Use the contractor's own project in the demo. Set up the first report together and agree the paid start date.

Test one expansion market

Start with a small Swedish pilot cohort. Compare paid conversion and support effort before scaling or adding the UK.

Acquisition evidence and the next measurements

Follow each monthly cohort from first contact through payment and renewal.

Evidence / channel	Observed so far	Measure next
All outreach, ~1 year	~80 approached, 6 ever paid	5 current, 1 churned; cohort retention
Direct outreach sample	55 calls, 7 demos booked	Trials and paid conversion by cohort
Facebook advertising	Paying customers reported	Attributed spend, new payers and CAC

Target contract value: €300/month = €3,600/year per company

Track each monthly cohort by country, channel, price and renewal.

$\text{CAC} = (\text{channel spend} + \text{allocated sales labour}) \div \text{new paying customers}$

Delivery costs and capacity

The next test must measure the labour behind each subscription.

Current software spend

About \$80 / month
\$40 OpenAI + \$40 hosting

Current delivery effort

About 3 hours to onboard
Under 1 hour/week per client

Measure before scaling

Track founder and developer time, support minutes and advertising spend.
Calculate contribution after delivery labour and variable software costs.

Team

20% ownership

Investment ask

€30,000 for 10% equity

Proposed terms: €270,000 pre-money valuation. Six-month validation budget.

Use of funds

Founder time	€18,000
Product and onboarding	€6,000
Acquisition tests	€3,000
Software and administration	€1,500
Contingency	€1,500

Six-month milestones

15 paying companies in total
At least 5 paying €300/month

80% retention after 8 weeks
Across eligible new paying customers

Support ≤30 min/client/week
Measured across paying customers

Planning assumptions: €3,000/month founder cost and €1,000/month product budget.

Milestones are targets. Existing revenue is additional buffer. Terms are negotiable.
